

AI Food Discovery and Order Support Assistant

BiteBuddy is an AI-assisted chatbot prototype embedded in a food delivery experience. Customers describe what they want in plain language, such as a healthy dinner under GBP 15 or a vegan meal with no peanuts. The assistant converts the request into visible filters, recommends matching dishes, explains why they fit, supports meal selection, guides the customer through a mock checkout and provides mock order tracking in the same conversation.

Product snapshot

Customer input

Mood, budget, diet, allergens

Assistant action

Interpret, filter, recommend, explain

Customer outcome

Select food, checkout and track order

Find food faster

Search by budget, diet, allergens and mood.

Stay in one journey

Move from recommendation to cart and tracking.

See why it matches

Recommendations use visible, explainable filters.

1. Product Overview

BiteBuddy reduces the effort required to browse menus and resolve routine order questions. It keeps food discovery, recommendation, selection, checkout and order support inside one guided assistant journey.

Customer journey

2. How the Assistant Works

Example: A customer asks for a healthy dinner under GBP 15. BiteBuddy returns a matching meal with price, tags and allergens.

GBP 11.95

Price stays within the stated budget.

Healthy + Vegan

Dietary tags remain visible.

Gluten, Sesame

Allergen information is shown.

Request-to-recommendation flow

1 Understand the request

Identify budget, dietary preference, allergen exclusions, meal type and intent.

2 Apply visible constraints

Create clear filters so the customer can see exactly what the assistant understood.

3 Match verified menu data

Search only structured dish, price, tag, allergen and delivery information.

4 Explain the result

Present a suitable meal and state why it meets the customer request.

Trust and control principles

- Filters remain visible and editable.
- Prices and delivery details come from menu data.
- Allergen information is shown, never hidden.
- The prototype makes no medical or dietary safety claims.
- No real customer, card or courier data is stored.

3. AI Business Analysis and Delivery

Role: AI Business Analyst and prototype delivery participant. The work focused on converting a customer problem into a clear, testable and reviewable product journey.

Delivery approach

4. Functional Requirements and Acceptance Evidence

ID	Requirement	Acceptance evidence in the prototype
FR-01	Accept a natural-language food request.	Customer can type or select a meal request inside the chatbot.
FR-02	Capture budget, dietary and allergen constraints.	Visible filter chips show the interpreted constraints and can be cleared.
FR-03	Recommend suitable menu items.	Returned meals match available tags, price and menu attributes.
FR-04	Explain why a result was selected.	Each result displays price, tags, allergens and a recommendation reason.
FR-05	Support selection and cart updates.	A customer can select a meal and see quantity, subtotal, fees and total.
FR-06	Provide a mock checkout journey.	The checkout shows address, delivery time, payment choice, tip and order total.
FR-07	Confirm a completed mock order.	The customer receives an order number, destination and estimated arrival.
FR-08	Provide order tracking in the chatbot.	The tracking view shows status stages, courier, ETA and time remaining.

Acceptance principles

Visible constraints | Recommendation within stated budget | Allergen information shown | Correct total calculation | Mock data only | No real payment processing

5. Portfolio Evidence - Discovery and Recommendations

Food discovery homepage

Trending meals, category navigation, search and the active cart are visible.

Chatbot welcome screen

The assistant introduces its purpose and provides suggested customer actions.

Healthy meal recommendation

A budget-based request returns a suitable meal with price, tags and allergens.

Dietary and allergen filtering

Visible filters show budget, vegetarian, healthy and peanut-exclusion constraints.

6. Portfolio Evidence - Checkout, Tracking and Outcome

Mock secure checkout

The customer reviews address, delivery time, payment option, tip, fees and total before placing the mock order.

Order confirmation and tracking

The chatbot confirms the order and shows courier details, status stages, estimated arrival and time remaining.

Delivered outcome

- End-to-end assistant journey from food request to order tracking.
- Reviewable evidence for requirements, UX, UAT and portfolio use.

Current limitations

- Restaurant, order, courier and payment data are fictional.
- The portfolio build uses controlled assistant logic and mock operations.

Recommended next release

- Secure live AI provider and production APIs.
- Accessibility, privacy, security, monitoring and performance testing.

Portfolio statement: A scoped, testable and reviewable AI-assistant product journey supported by verified prototype evidence.
