Business Problem 1: The ERP systems are in scope for the upgrade

Business requirement: The business needs to identify and document all ERP systems, local applications and key integrations included in the upgrade scope.

Why

As a ERP Program Manager,

I want to have a complete list of all ERP systems and connected local applications included in the upgrade,

So that I can confirm the project scope, plan migration activities and manage system dependencies across all regions.

Acceptance Criteria 1:

Given the company has ERP systems and local applications across multiple regions,

When the upgrade scope is reviewed,

Then all in-scope systems should be documented with region, business owner, purpose and key business processes supported.

Acceptance Criteria 2:

Given some local systems may connect with the ERP,

When the system inventory is finalized,

Then all major integrations and data dependencies should be identified.

Acceptance Criteria 3:

Given the upgrade scope may change during the project,

When any ERP system is added or removed from scope,

Then the change should be approved and recorded in the project documentation.

Acceptance Criteria 4:

Given the project team needs to manage delivery risk,

When the final scope is confirmed,

Then the team should have one agreed source of truth for all in-scope systems.

Business Problem 2: Security standards need to be put in place

Business requirement: The business needs consistent security standards for user roles, access approvals, access reviews and segregation of duties in the upgraded ERP environment.

Why

As a Security and Access Management Lead,

I want standard security rules for user roles and access permissions in the upgraded ERP system,

So that only authorized users can access sensitive transactions, reports and financial data.

Acceptance Criteria 1:

Given a user needs access to the ERP system,

When the access request is submitted ,

Then it should be reviewed ,

And approved by the correct manager or business process owner before access is granted.

Acceptance Criteria 2:

Given users have different job responsibilities,

When roles are assigned in the ERP system,

Then access should match the user's role and business need.

Acceptance Criteria 3:

Given segregation of duties risks can occur,

When conflicting access is detected,

Then the system should flag the issue for review and remediation.

Acceptance Criteria 4:

Given access rights can become outdated,

When periodic access reviews are completed,

Then inappropriate, duplicate or expired access should be removed or formally approved as an exception.

Business Problem 3: Requirements for SOX controls need to be put in place

Business requirement: The business needs clearly defined SOX control requirements within the upgraded ERP system to support financial reporting compliance and audit readiness.

Why

As a Compliance Manager,
I want SOX control requirements to be defined, documented and monitored in the upgraded ERP system,
So that financial reporting controls are consistent, traceable and ready for audit review.

Acceptance Criteria 1:

Given the company must comply with SOX requirements,
When financial processes are configured in the ERP system,
Then relevant SOX controls should be identified and documented.

Acceptance Criteria 2:

Given controls may be manual or automated,
When the control design is reviewed,
Then each control should show the control owner, control frequency, evidence required and testing approach.

Acceptance Criteria 3:

Given control failures may occur,
When a SOX control exception is identified,
Then the issue should be logged, assigned to an owner and tracked until remediation is complete.

Acceptance Criteria 4:

Given audit evidence is required,
When a control is performed,
Then the ERP system or related compliance process should retain appropriate evidence for audit review.

Business Problem 4: Timeline for implementing the upgrade

Business requirement: The business needs a clear implementation timeline with key milestones, owners, dependencies and readiness activities to support a controlled ERP upgrade.

Why

As a ERP Program Manager,
I want a clear implementation timeline for the ERP upgrade,
So that the project team can track progress, manage risks and deliver the upgrade on time.

Acceptance Criteria 1:

Given the ERP upgrade involves multiple regions and teams,

When the implementation plan is created,

Then it should include key milestones, target dates, responsible owners and major dependencies.

Acceptance Criteria 2:

Given delays may affect the overall project,

When a milestone is at risk,

Then the issue should be escalated to project leadership with an agreed action plan.

Acceptance Criteria 3:

Given the business needs to be ready before go-live,

When the go-live date approaches,

Then training, testing, access setup, controls validation and support planning should be completed.

Acceptance Criteria 4:

Given post-go-live support is required,

When the ERP upgrade goes live,

Then a support process should be available to track defects, access issues, control issues and user feedback.
